

MAIL WASHER SETUP

Setup is under the TOOLS menu (shareware, please donate to the author)

This handy program downloads the Mail 'headers' from your mail account and gives you a chance to delete or bounce unwanted messages. You can also preview them (doesn't show attachments). Bounced mail will automatically come back marked as "blacklisted" if the same sender tries again. It will also warn if viruses are suspected (not all viruses are caught) and give you a chance to delete them. Once the mail is 'processed', it calls your regular mail program to download the messages you want to keep.

* hint: If you live where there is a slow connection and your e-mail hangs because of a large attachment [you'll see downloading # XX of XXX and it

never goes past that] You can close it, restart Mailwasher and delete the offending message!

- Get the Mail
- Previously bounced
- Choose: Bounce to send back, Delete if you don't want to read it, or leave to keep the message
- When you are done, Process the Mail will send unwanted mail back to sender, delete it and call your regular program up to take only the messages you want.
- After a while, the senders tire of bounced mail and remove you from the list!
